# PROBLEM STATEMENT

## Spatial Random Fields SRF

Dual-pol backscatter

InSAR coherence

Digital surface models

SRFs depend on forest  
geometric (horizontal and  
vertical structure functions)  
and dielectric properties

## SRF SPATIAL STATISTICS

How well do these statistical  
features characterize the  
forest spatial distribution?

**Caveat: these features are  
not measures of the forest  
geometry (e.g. crown width,  
tree density)**

# STATISTICAL MEASURES AND TOOLS

Two-point statistic:  
Structure Function of  
order 2

$$\langle (f(\mathbf{x}) - f(\mathbf{x} + \boldsymbol{\tau}))^2 \rangle \approx \langle w^2 \rangle$$

Slant range dual-pol power and  
coherence data (mono bi-static)

Spatial random field

Two-point statistic  
provided by wavelet  
coefficients

## WASS Wavelet Scaling Signature

Wavelet Variance as  
a function of scale

Multivoice wavelet  
frame transform

# STATISTICAL MEASURES AND TOOLS

## More wavelet statistics.....

$$\langle W_s^2(x) \rangle = f(s)$$

**Wavelet variance**

**Autocorrelation  
Non-stationarity**

$$\frac{\langle W_s^4(x) \rangle}{\langle W_s^2(x) \rangle^2} = f(s)$$

**Wavelet normalized  
fourth moment (kurtosis):  
flatness factor**

**Intermittency  
Flatness of PDF tails**

$$\langle Wx_s(x) \times Wy_s(x) \rangle = f(s)$$

**Wavelet Cross-covariance**

**Crosscorrelation**

# Wavelet variance scaling for random fields: examples

## White noise

$$G(\omega) = \text{const} \quad \Re(x) = \delta$$

## Non-stationary Brown 1/f

$$G(\omega) = \frac{\sigma^2}{|\omega|^\beta}$$

# Wavelet variance scaling for random fields: examples

## Correlated Noise

$$\mathfrak{R}(x) = \frac{\pi K \beta}{2} e^{-\beta x}$$

$$G(\omega) = \frac{K \beta^2}{\beta^2 + \omega^2}$$
