

Application of TanDEM-X interferometry in volcano monitoring using Merapi, Indonesia and Volcán de Colima, Mexico as test sites

Geodetic Institute, Department of Civil Engineering, Geo and Environmental Sciences

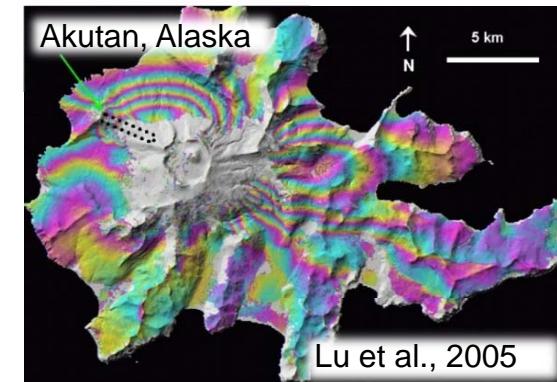

Scope of the study

- **Motivation:** The repeat pass intervals of current radar satellite missions are between 11 and 35 days

➤ **low coherence** in summit areas, near lava domes and above lava flows

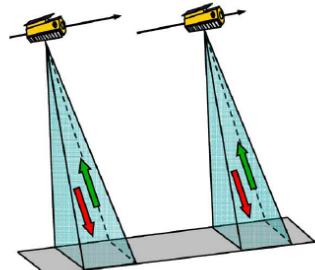

- **General aim:** Analysis of the capacity of the TanDEM-X mission to monitor topographic changes of dome building volcanoes

➤ **topography** is an important parameter in volcano research

➤ allows to estimate **volume growth rates**, **volume changes** and **mass loss suffered** during an eruption

Monostatic vs. bistatic InSAR

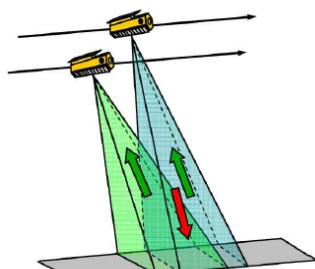

$\Delta t \geq 11$ days

Repeat-pass missions (monostatic)

$$\phi_{\text{insar}} = \phi_{\text{topo}} + \phi_{\text{def}} + \phi_{\text{atm}} + \phi_{\text{orbit}} + \boxed{\phi_{\text{scat}}} + \phi_{\text{noise}}$$

Often problematic along volcanoes

$\Delta t = 0$ days

TanDEM-X (bistatic)

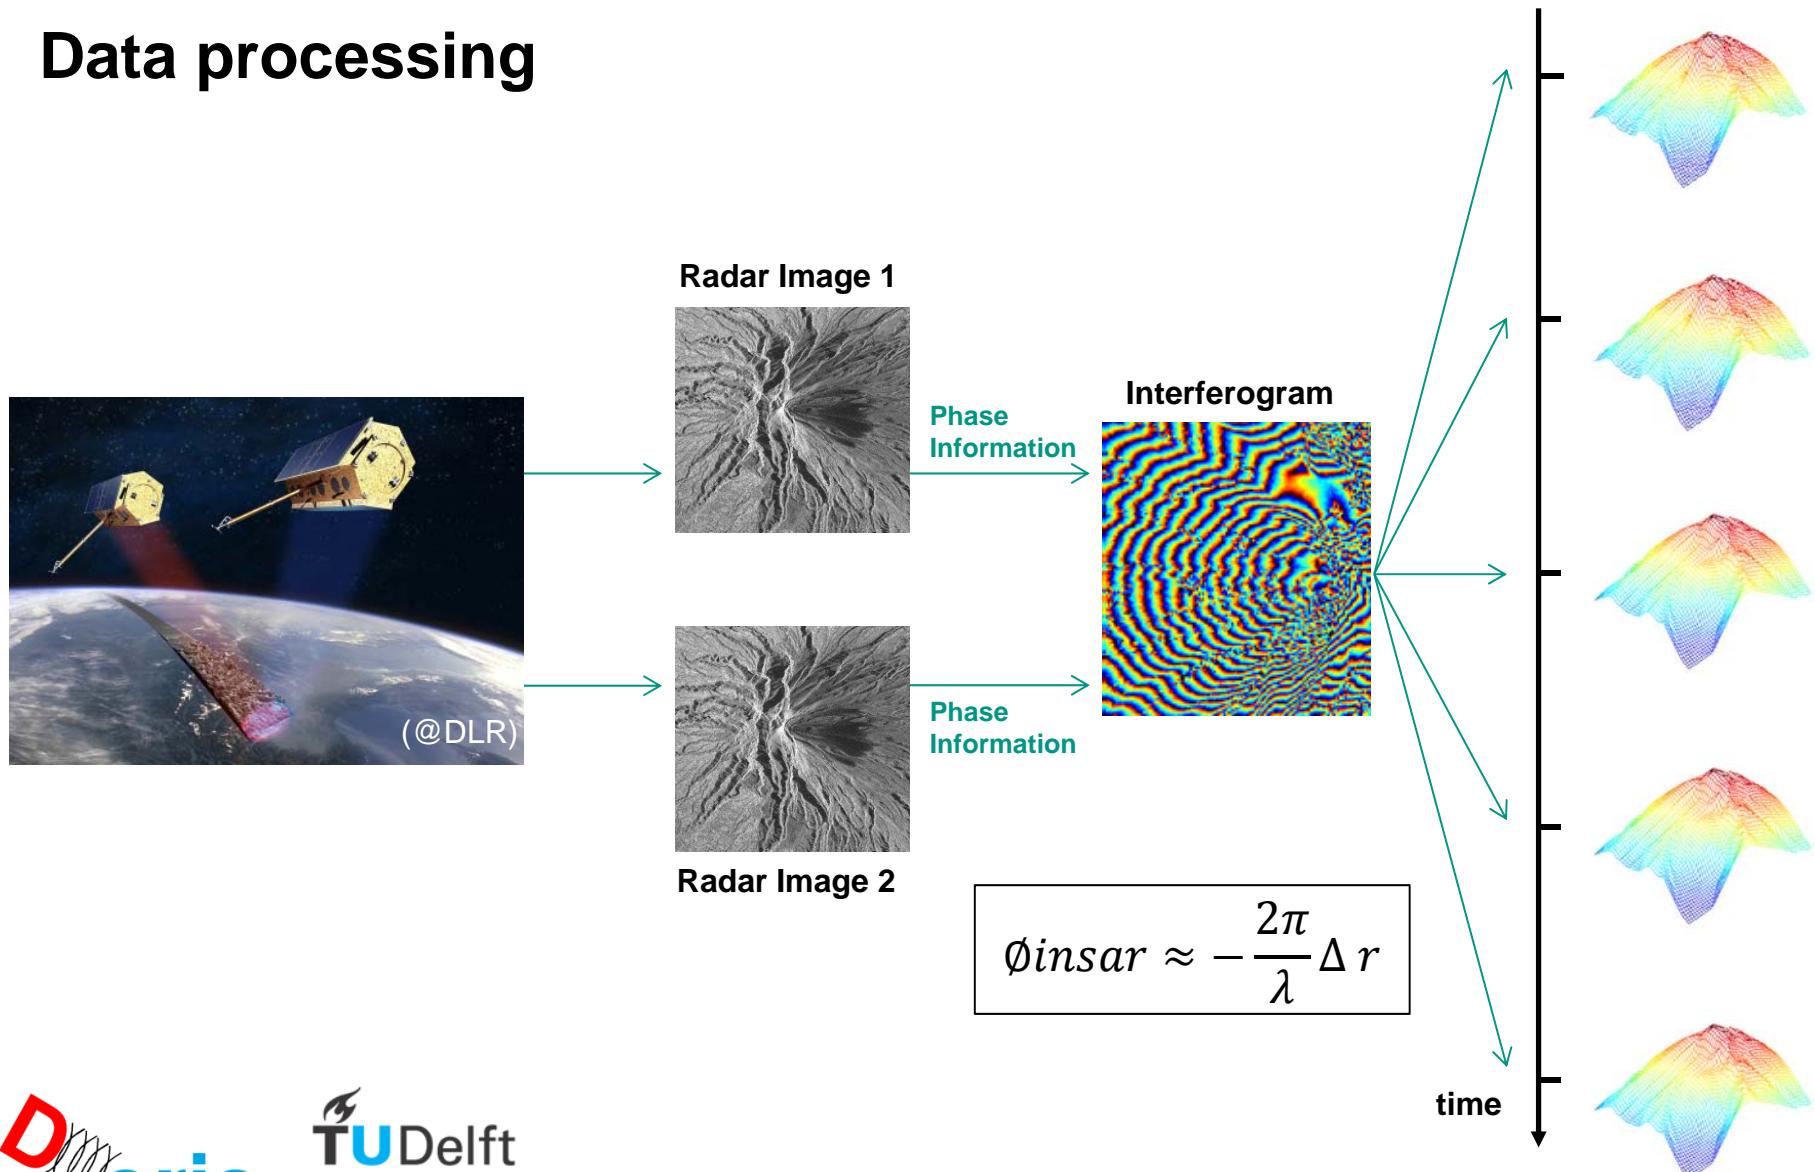

$$\phi_{\text{insar}} = \phi_{\text{topo}} + \phi_{\text{def}} + \phi_{\text{atm}} + \phi_{\text{orbit}} + \boxed{\phi_{\text{scat}}} + \phi_{\text{noise}}$$

No problem any longer

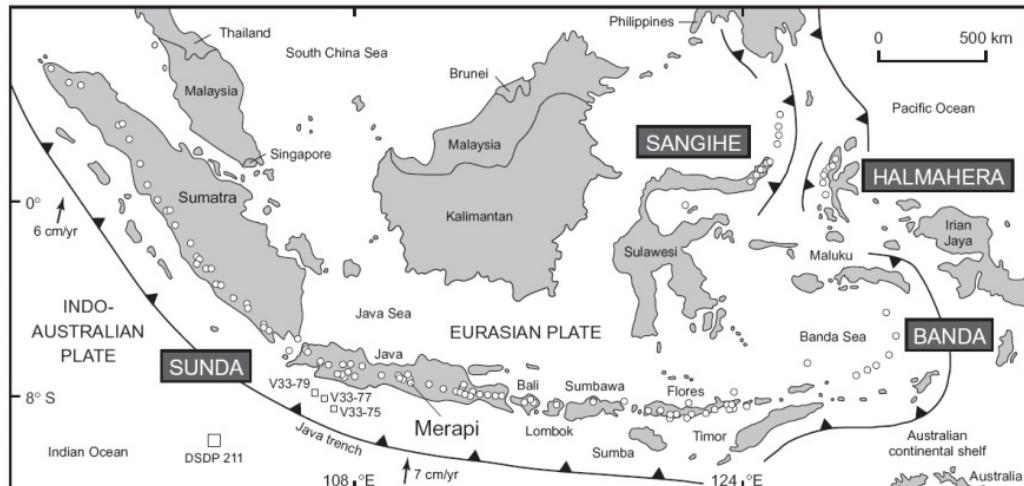

Krieger et al. 2007

- Enables to quantify volumetric mass movements

Data processing

Merapi, Java, Indonesia

Merapi 2010 eruption

- Explosive eruption on 26 Oct. 2010 destroyed the 2006 lava dome
- a phase of rapid dome growth followed
- new dome was destroyed again on 4th-5th Nov.
- New dome was built on 6th Nov.

Analysis of Merapi DEM cross sections

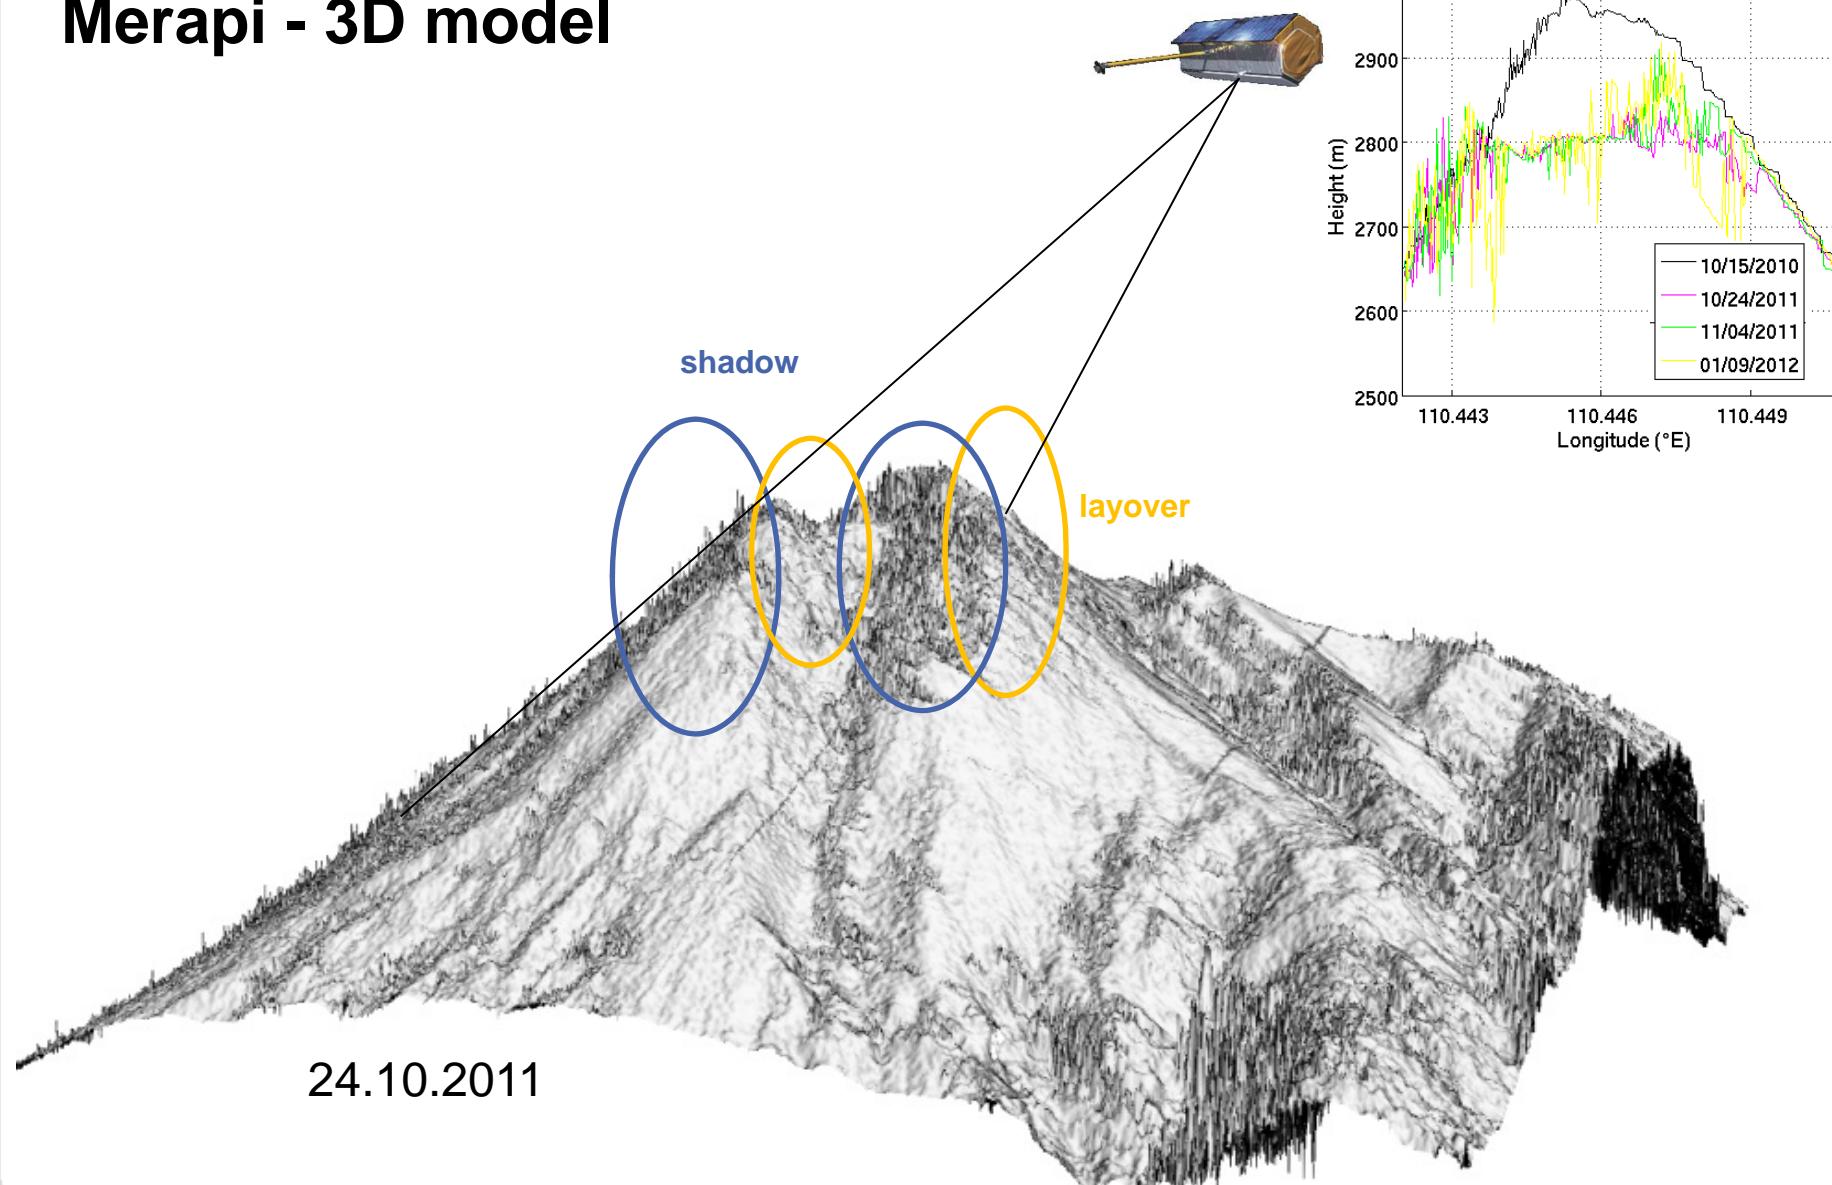

Height change

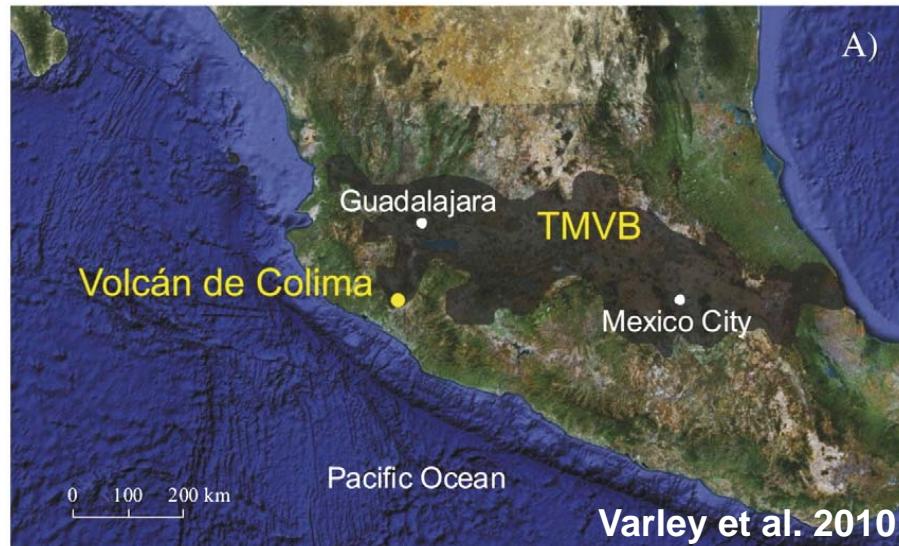

Pallister et al. 2012: ~14 500 000 m³

Merapi - 3D model

Volcán de Colima, Mexico

- Stratovolcano located on the Trans-Mexican Volcanic Belt
- 100-year cycles dominated by dome growth and intermittent eruptions, culminating in complete dome destructions

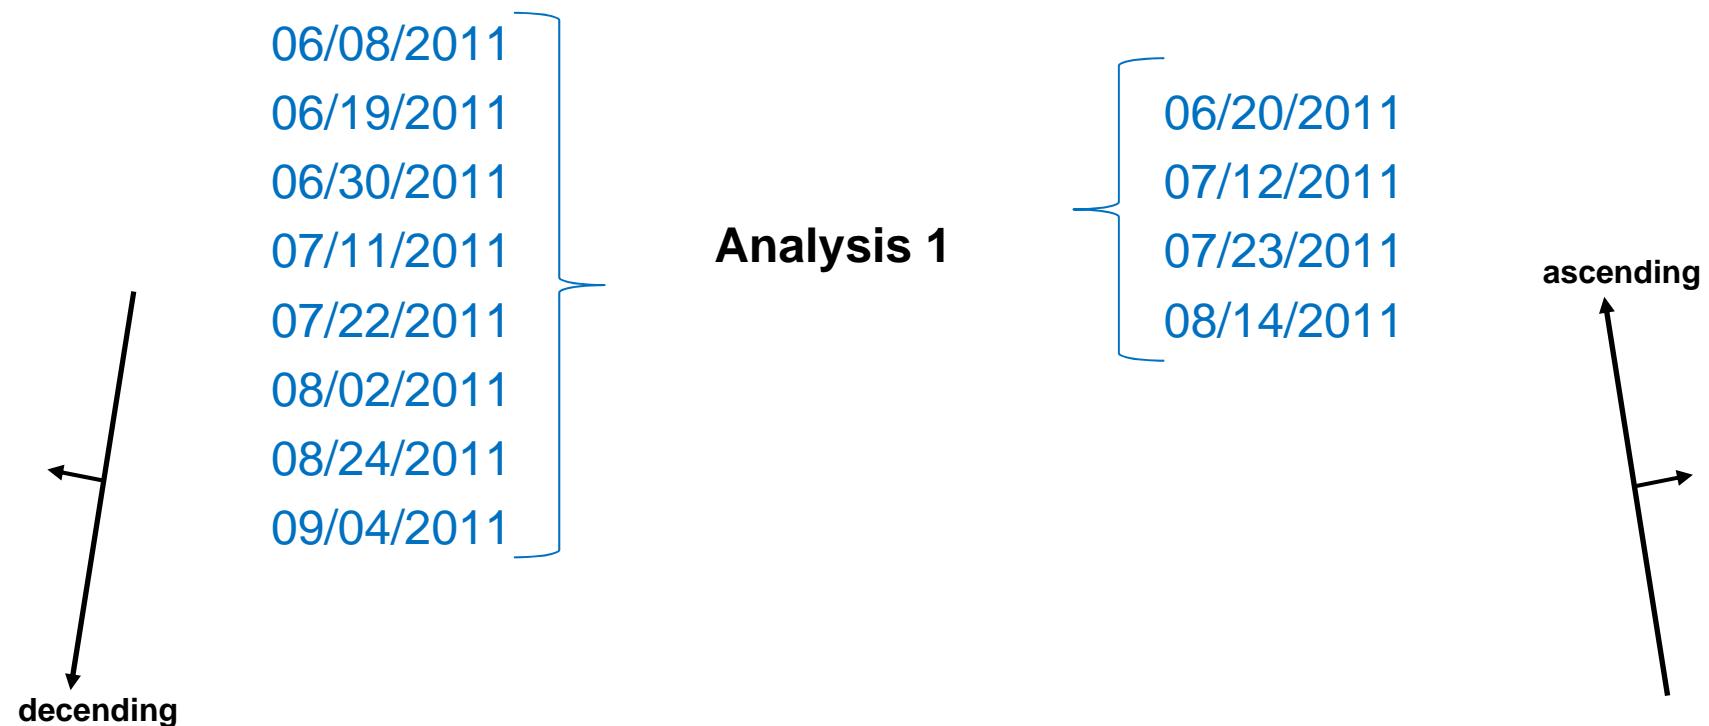

Recent eruptive activity

4 episodes of dome growth

- 1998-1999
- 2001-2003
- 2004
- 2007-2011
- New activity since January 2013
